                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732.114 [gb]AFI29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /lab_host="E. UNeoSV1 gene trap. Tag generated by plasmid rescue. Additional
uneoSV1 gene trap. Tag generated by plasmid rescue. Additional
sequence information and target gene cloning can be generated. ES
cell line harboring insertion mutation of target gene is available.

(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWDA2 (gil4732114|gb|AF129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072,1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymelectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note="Vector: PWD42nv; Purified genomic DNA from M. musculus C57BL/6J (male) was obtained from the Jackson

The invention relates to a method of assigning an expression pattern of transposable elements to the level of developmental potential of a cell.

Disclosure; SEQ ID NO 527; 50pp; English

Assigning an expression pattern of transposable elements to the level of developmental potential of a cell comprises determining expression of one or more families of transposable elements, and assigning the expression pattern.

WPI; 2004-804756/79.

Mcdonald JF;

29-APR-2003; 2003US-0466801P.

In assigning an expression CC pattern of transposable elements to the level of developmental potential CC of a cell, the cell is a fully pluripotent stem cell, or a differentiated cell. The expression pattern is determined by CC microarray analysis. One or more of the families of transposable elements cell, or consisting of CC families of retroveruses (ERVe), a family of short interspersed nuclear celements (SINES) and a family of long interspersed nuclear elements (LINES). The expression of the transposable elements celements is measured by CC assaying for the mRNA transcribed from the genes or proteins translated celement of transposable elements is determined and used to form the gattern of expression. The methylation of the transposable element genes cell from the genes or proteins translated celements of the methylation of the transposable element genes of specific PCR. The methylation pattern is determined by microarray canalysis. The methylation pattern is determined by microarray analysis. The methylation pattern are useful for assigning an cell. This sequence represents an oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

Also disclosed are a method of determining the developmental potential of a stem cell, a method of identifying a cellular differentiation induction factor, a method of identifying a factor that increases the developmental potential of a cell, a method of assigning a methylation pattern of transposable
                                                                                                                                                                                                                                                                            29-APR-2004; 2004WO-US013522

Determining expression, methylation or chromatin status pattern

of f

New system for leukocyte expression profiling, diagnosing a disease, or monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides.

WPI; 2002-636525/68.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     method of assigning an expression pattern of transposable elements to a crype of cancerous cell in a sample, a method of diagnosing cancer, a method of determining the effectiveness of an anti-cancer therapeutic in a subject, a method of assigning a methylation pattern of one or more cancilles of transposable elements to a type of cancerous cell in a sample cancers to a type of cancerous cell in a sample. The method is useful in determining an expression, methylation or chromatin status pattern of one or more families of transposable elements (e.g. LINE, long interspersed conclear element, SINE, short interspersed nuclear element, or HERV, human candogenous retrovirus) in a sample for diagnosing cancer or determining the effectiveness of an anti-cancer therapeutic. The present sequence is a representative sequence for a human transposable element, used in a microarray to study the expression, methylation or chromatin status cancer of the transposable elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

comprises one or two isolated DNA molecules that detect expression, which gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ000010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infertice.

                                                      The present invention relates to a multivalent antibody comprising at least one antigen recognition site specific for a lymphotoxin-beta receptor (LT-\&bgr_i-R) epitope. The antibody is useful for preparing a medicament for the treatment of cancer. The composition and method are used for diagnosing or treating cancer and for inhibiting tumour volume. The present sequence represents a primer of the invention.
                                                                                                                                                                      New multivalent antibody constructs beta receptor, useful for diagnosing

cc variety of detection assays, including hybridisation assays, nucleic acid carrays and PCR-based methods. The invention also encompasses methods of cevaluating and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide polymorphism (SNPs), may be used in studying the relationship between CC polymorphisms (SNPs), may be used in studying the relationship between CC drugs. SNPs are also useful as polymorphism markers for discovering genes to that cause or exacerbate certain diseases, conditions, and responses to that cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations such as repeating sequences. The detection and analysis of polymorphisms in genes encoding drug metabolising enzymes allows the customisation of carug therapies based upon the genetic profile of individual patients. This would not only take the guesswork out of selecting the drug with the greatest therapeutic effect for a particular patient, but would also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                  encoding enzymes associated with drug metabolism. The invention relate to methods and compositions for identifying individuals who have at le one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes primers specific for a sequence selected from ABZ43217-ABZ50887 using primers specific for a sequence selected from ABZ43217-ABZ50887 using
                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying individuals having a polymorphism, useful for determining effectiveness or side effect of a drug or treatment protocol, comprise detecting at least one polymorphism in the drug metabolizing enzyme nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    27-DEC-2000; 2000JP-00399443

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                reduce the likelihood of adverse reactions, thereby increasing safety. Methods of the invention are also useful in the drug discovery and approval processes. For example, individuals could be selected for clinical trials only if their genetic profiles indicate that they are capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more appropriate patient populations. The methods, data and compositions of the invention may therefore lead to a an increase in the range of possible drug targets and decreases in the number of adverse drug reactions, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy
encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at lease polymorphism in such drug metabolising annumeration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; drug metabolising enzyme; gene; drug metabolism; chromosome polymorphic site; drug evaluation; drug screening; genotyping; genetic profiling; therapeutic customisation; adverse reaction; clinical trial; drug approval; single nucleotide polymorphism; SNP,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cc polymorphisms may be identified in a nucleic acid sample using probes or cc primers specific for a sequence selected from ABZ43217-ABZ50887 using a clarry and pcR-based methods. The invention also encompasses methods of cc evaluating and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide polymorphism (SNPs), may be used in studying the relationship between CC drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations such as repeating sequences. The detection and analysis of polymorphisms in genes encoding drug metabolising enzymes allows the customisation of creduce the likelihood of adverse reactions, thereby increasing safety. This would not only take the guesswork out of selecting the drug with the greatest therapeutic effect for a particular patient, but would also reduce the likelihood of adverse reactions, thereby increasing safety. Methods of the invention are also useful in the drug discovery and capable of responding to a particular foruginest they are capable of responding to a particular foruginest that they are capable of responding to a particular drug out class, and previously failed drug candidates could be revived if they were matched with more approved by a staget and decreases in the number of adverse drug check the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy of the length of time patient are on medication and the number of different medications apatient needs to take before finding an effective therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

CC construct comprising a cytokine receptor binding domain incorporated in a
CC suitable molecular scaffold so that the scaffold maintains the binding
CC domain in a configuration suitable for binding to the cytokine receptor.
CC The peptides of the invention may have cytostatic, virucide,
hepatotropic, antiinflammatory, neuroprotective, immunosuppressive and
CC construct is useful in the manufacture of a medicament as an interferon
CC (IFN) mimetic. A peptide that mimics the effect of IFN is useful in
CC medical therapies for cancer, haematological malignancies, viral
CC such as arthritis B or C), multiple sclerosis and autoimmune diseases
CC such as arthritis, to detect modulators of IFN action, in screening
CC such as arthritis, to detect modulators of IFN action, in screening
CC such as arthritis, to detect modulators of IFN action in screening
CC such as arthritis, to detect modulators of IFN action in screening
CC such as arthritis, to detect modulators of IFN action in screening
CC such as arthritis. The activity and/or interaction with another molecule
CC related disorders. A nucleic acid encoding the peptide of the invention
CC or is useful for the treatment and therapy of the mentioned medical
CC conditions. The peptide of the invention has less side effect than those
CC conditions. The peptide of the invention has less side effect than those
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               X202020202020202020202020202020X
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC 31-mer double stranded oligonucleotides corresponding to the cytochrome CC P450 subfamily CYP3A5 5' untranslated region containing a polymorphism at CC -147 (G) or wild-type (A) sequence were used in an electrophoretic CC mobility shift assay (EMSA). The assay showed that -147 polymorphism CC transcription regulatory regions can be screened for the presence/Absence CC of a polymorphic variant, preferably at positions -475 or -147 of the DNA CC of the 5' flanking region adjacent to the CYP3A5 coding sequence. The CC variants are present in an activator protein-3 (AP-3) motif and/or a basic transcription element (BTB). The polymorphisms cause increased CC cativity. Screening for the presence of variants cause increased CC cyp3A5 gene expression and this has been linked to drug metabolic CC cativity. Screening for the presence of variants can be used to identify Cypothrome CYP3A5 expression. Primers are used which in addition to CC hybridizing to the site of interest, are capable of introducing a CP colymorphic variants. Restriction enzyme cleavage analysis can then be used to indicate the presence or absence of the variant. The methods are cused to establish, before treatment with a drug, whether the drug will be effectively metabolized by the patient, to identify compounds and CC chanscription factors that can bind to a DNA sequence encoding CYP3A5, effects of a compound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

This primer binds to the 3' of CC the heavy chain coding region. The amplified products are cloned to CC produce a variegated display library (VDL) of antibody variable regions. CC The antibodies are generated by an immunotolerant individual against an CC antigen. The VDL can be used to generate an antibody against a CC immunorecessive antigen e.g. a cell surface marker on a foetal, cancer or CC stem cell, which can differentiate between variant or related forms of CC the antigen. The antibodies generated can be used in the diagnosis, e.g. CC detection of the immunorecessive antigen, or in therapy e.g. of cancer, CC Alzheimer's disease or familial hypercholesterolaemia. The method of CC production of the antibody allows rapid and sensitive isolation of CC antibodies produced have greater binding affinity than those produced by CC combinatorial/hybridoma methods

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection
                                                     This 3' primer is used with a consensus 5' primer (see AAT97179) for the PCR amplification of the human T cell receptor (TCR) alpha chain extracellular domain DNA. The 3' connection for the TCR alpha chain is made after Asn-110 of the constant region of the alpha chain. The methods of the invention allow large quantities of soluble TCR to be produced in a rapid manner. Customised tumour cell vaccines comprising soluble TCR are obtained for the treatment of lymphoma and leukaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 T cell receptor
                                                                                                                                                                                                                                                                                                                                                          Multivalent vaccine to treat B cell lymphoma or leukaemia - comprises least 2 different recombinant variable regions of immunoglobulin molecules derived from B cell lymphoma cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                01-MAY-1996;

Rubisco LSMT catalyses methylation of the epsilon-amine of Lys-14 in the Rubisco large subunit. Vectors containing the LSMT gene could be used to introduce the Rubisco LSMT gene into plants that do not naturally possess it, e.g. Arabidopsis thaliana. The vector could be conjugated to agents that modulate Rubisco activity in plants. Antisense molecules based on the Rubisco activity in plants. Antisense molecules based on the gene in plants as a herbicidal measure. Probes based on the Rubisco LSMT gene sequence could be used to block expression of the gene in plants as a herbicidal measure. Probes based on the Rubisco LSMT gene sequence could be used to detect homologous genes in plants other than

                                                                                                                                                                                                                                                                                                                                                                                                                              PCR primers AAV16927-44 represent sense and antisense PCR primers from a degenerate pool encoding ribulose-1.5-bisphosphate carboxylase/oxygenase (Rubisco) large subunit epsilon-N-methyltransferase (protein methylase III or Rubisco LSMT) peptic peptide P18 (AAW46946). Rubisco LSMT catalyses methylation of the epsilon-amine of Lys-14 in the Rubisco large subunit. Vectors containing the LSMT gene could be used to introduce the Rubisco LSMT gene into plants that do not naturally possess it, e.g. Arabidopsis thaliana. The vector could be conjugated to agents that modulate Rubisco activity in plants. Antisense molecules based on the Rubisco the Rubisco activity in plants. Antisense molecules based on the Rubisco LSMT gene sequence could be used to block expression of the gene in plants as a herbicidal measure. Probes based on the Rubisco LSMT gene sequence could be used to block appression of the gene in plants as a herbicidal measure.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a primer from a degenerate pool of primers synthesised based on the peptide P18 (AAW75489) from the pea Rubisco (Ribulose-1,5-bisphosphate carboxylase/oxygenase) large subunit epsilon-N-methyltransferase (LSMT). The primer is based on the sense strand encoding the peptide P18 and is used in the isolation of the pea Rubisco LSMT from a cDNA library. The Rubisco LSMT gene encodes a protein of 489 amino acids with a predicted molecular weight of 55 kD. Recombinant Rubisco LSMT enzyme is a methyltransferase that catalyses methylation of the epsilon-amino group of Lys-14 in the large subunit of Rubisco
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Recombinant Rubisco LSMT methyltransferase enzyme - that methylates the lysine epsilon-amino group of Rubisco.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          02-FEB-1999.

```

Example 4; Col 13-14; 28pp; English.

This sequence represents a primer from a degenerate pool of primers synthesised based on the peptide P18 (AANT5489) from the pea Rubisco (Ribulose-1,5-bisphosphate carboxylase/oxygenase) large subunit epsilon-N-methyltransferase (LSMT). The primer is based on the antisense strand encoding the peptide P18 and is used in the isolation of the pea Rubisco LSMT from a CDNA library. The Rubisco LSMT gene encodes a protein of 489 amino acids with a predicted molecular weight of 55 kD. Recombinant Rubisco LSMT enzyme is a methyltransferase that catalyses methylation of the epsilon-amino group of Lys-14 in the large subunit of Rubisco

#### SCORE OVER LENGTH SEARCHES

Attached is a score over length search. This search was developed to overcome limitations in most standard search systems which favor large sequences with high scoring, but lesser overall identity over smaller sequences with higher overall identity. This search is especially useful for relatively small nucleic acid or polypeptide target sequences (antisense, fragments, probes, primers, RNAi, epitopes, haptens, etc.) claimed functionally via a form of hybridization and/or identity language and having defined upper and lower polynucleotide and or polypeptide length limits.

The score over length search is performed by first running the query sequence using examiner-specified identity and polynucleotide or protein length limit parameters, and saving 65,000 hits and 0 alignments from each desired database. The resulting output is reformatted using a Microsoft Word macro and is imported into Excel. The summary table data are then sorted by the ratio of score of each hit sequence divided by its length and the accession numbers for all hits below the examiner's desired score over length parameters are deleted. The remaining accession numbers are used to pull the corresponding sequences from the databases into subdatabases enriched for good hits and the query sequence is re-run against these subdatabases to yield the final results.

The score over length cutoff for this search is 70%, length 10-241 nt.

Examiner Please Note: This cover sheet should be included when submitting results to be scanned.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

APPLICANT: Deutekom van, Judith C.T.
APPLICANT: Dunnen den, Johannes T.
APPLICANT: Dunnen den, Johannes T.
APPLICANT: Aartsma-Rus, Annemieke
TITLE OF INVENTION: Modulation of exon recognition in pre-mRNA by
TITLE OF INVENTION: interfering with the secondary RNA structure
FILE REFERENCE: P63917US01
CURRENT APPLICATION NUMBER: US/11/233,495
CURRENT PILING DATE: 2005-09-21
PRIOR APPLICATION NUMBER: PCT/NL2003/00214
PRIOR APPLICATION NUMBER: PCT/NL2003/00214
PRIOR FILING DATE: 2003-03-21
NUMBER OF SEQ ID NO 7
LENGTH: 19
TYPE: RNA
ORGANISM: Artificial Sequence
